Patent No. 6703491

GENERAL INFORMATION

GENERAL INFORMATION

APPLICANT: Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster

FILE REFERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT PILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SEQ ID NOS: 62517

SEQ ID NO 16975

LENGTH: 472

Detecting and identifying ovarian tumor, identifying increased risk for developing ovarian cancer, and determining effectiveness of ovarian cancer treatment, by measuring expression level of ovarian tumor marker P-PSDB; ABB50282

23; Page 98; 140pp; English. Claim

The invention relates to methods for diagnosing and prognosing ovarian tumours in an individual via the detection and measurement of the expression of ovarian tumour marker genes (ABA83081-ABA83122, ABA83180,

ABAB3181 and ABAB3183). Or segments thereof (Maba312-Abab312), Abab317, Abab3181 and ABAB3181 or segments thereof (Maba3181) are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for monitoring a patient in remission from ovarian cancer and in tests for monitoring disease status in a patient being treated for ovarian cancer. The methods can additionally be used to identify a particular tumour as being an ovarian tumour (i.e., an sepitalial ovarian tumour selected from serous cystadenoma, borderline serous tumour, mucinous cystadenoma, borderline mucinous tumour, mucinous cystadenocarcinoma, endometricid carcinoma, undifferentiated carcinoma, clear cell adenocarcinoma, cystadenofibroma, adenofibroma and Brenner cumour. The ovarian tumour marker genes of the invention were identified using SAGE (serial analysis of gene expression) and were found to be overexpressed in a broad variety of ovarian epithelial tumour cells containtie to normal ovarian epithelial cells. The marker genes are membraned in mplicated in immune response pathways, in the regulation of cell considered in addition to their wee as disagnostic and considered in addition to their wee as disagnostic and considered in addition to their wee as disagnostic and considered to the considere segments thereof (ABA83123-ABA83169, ABA83179, prognostic markers, the ovarian tumour marker genes or their encoded proteins may be used as therapeutic targets for the treatment and prevention of ovarian cancer. Sequences ABA831081-ABA83122, ABA83180, ABA83182 and ABA83184 represent the ovarian tumour marker genes of the ABA83182 and ABA83181 and Invention

New NOVX polypeptides and nucleic acids, useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 20; SEQ ID NO 141; 211pp; English

This invention relates to novel NOVX proteins, and the DNA sequence which encode them, having properties related to stimulation of biochemical or physiological responses in a cell, a tissue, an organ or an organism. Compounds which modulate the proteins of the invention may have cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antirheumatic, antiarthritic, antidabelto, nephrotropic, dermatological, immunosuppressive, anti-HIV, antihflammatory, neuroprotective, nootropic, antipsoriatic, antihparkinsonian, antiasthmatic, neuroleptic, antidepressant, antiallergic or gynaecological activities. The DNA sequences of the invention may be useful for gene therapy whilst the 'protein sequences may allow the development of a vaccine. The protein is useful in the manufacture of a medicament for treating a syndrome

05-NOV-2001; 2001EP-00126244.

```
associated with a human disease. The invention may be useful in diagnosing, treating or preventing NOVX-associated disorders, for example cardiomyopathy, atheroscierosis, hypertension, cancer, obesity, rheumatoid arthritis, diabetes, glomerulonephritis, psoriasis, skin disorders, AIDS, inflammation, multiple sclerosis, Alzhaimer's disease, Parkinson's disease, asthma, schizophrenia, depression, allergies or fertility disorders. The nucleic acids may further be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The present sequence is the cDNA sequence which encodes the human NOVX27a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           81 ProThrhrgArgLysProGlyLysCysProValThrTyrGlyGlnCysLeuMetLeuAsn 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120

HUSI-type I inhibitors are useful for treating chronic bronchitis, chronic cervical inflammation, inflammation associated with excessive mucus prodm.; post-operative bleeding caused by hyperfibrinolysis, and shock. They are esp. suitable for administration as spray or inhalation. The expression control sequence on the DNA fragment in AAN7028 is bound to the 5' end of HUSI cDNA in an expression vector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAGAGATGTTGTCCTGACACTTGTGGCATCAAATGCCTGGATCCTGTTGACACCCCAAAC 253
                                                                                                                                                                                                                                                                                           The present invention relates to a method (M1) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for treating endometriosis in a subject, comprising administering to the subject an amount of antileukoprotease (ALP) effective to inhibit the activity of elastase or cathepsin G, thereby inhibiting ectopic implantation of endometrial fragments. The present sequence is the coding sequence for human ALP. ALP proteinase inhibitor (SLPI) and alphaiproteinase inhibitor (SLPI) and alphaiproteinase inhibitor (alphai-PI). ALP plays an important role in the defence of epithelial surfaces against proteolytic damage

Thyroid cancer related gene sequence SEQ ID NO:5885.

15-MAY-2002 (first entry)

```
The present line interacts to a new method to assist and present line control non-ovarian cancer sample, where the expression level of a marker in a control non-ovarian cancer sample, where the marker is selected from 363 cancer markers described in the cancer sample, where the marker is selected from 364 cancer markers described in diagnosing or cancer said the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing cancer, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing cancer). The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and tyral meningitis, Alzheimer's disease or Parkinson's disease), brain disorders (e.g. bacterial or viral meningitis or encephalitis), inflammations (e.g. bacterial or viral meningitis or encephalitis), connective tissue disorders, or heart disorders (e.g. ischaemic heart disease or atherosclerosis). The compositions and methods may also be overian cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metaatasized or is likely to metastasize, selecting a composition for inhibiting ovarian cancer, assessing the ovarian cancer or at risk of developing ovarian cancer. The present nucleic acid the content of the ovarian cancer markers described in the
present invention relates to a new method for assessing whether a

The present invention describes a method (MI) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, decermining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, clear cell cancer, infiltrating lobular cancer, squamous cell cancer, infiltrating lobular cancer, squamous cell cancer, infiltrating lobular cancer, squamous cell cancer such and milm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tumour

Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set. Horrigan S; Endress G, Ebner R, Claim 1; SEQ ID NO 5016; 44pp; English. Carter KC, Augustus M, Weaver Z; WPI; 2002-188264/24. Young PE, 1 Soppet DR, Soppet

(AVAL-) AVALON PHARM

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is

the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's

The invention relates to diagnosing an inflammatory lung disorder in a mammal, comprising comparing the expression of a nucleic acid encoding an antileukoprocease polypeptide in mammal-derived cell population, and expression of a nucleic ancid encoding the antileukoprocease in an inflammation positive or negative reference profile. Also disclosed are a method for identifying a compound that inhibites lung inflammation comprising a compound that inhibites lung inflammation or attileukoprocease. In the cell, where a decrease, contacting the cell with a test compound and measuring the expression of antileukoprocease in the cell, where a decrease in expression in the presence of the test compound compared to that in the absence of the test compound compared to that in the absence of the test compound compared to that in the absence of the test compound compared to that in the absence of the test compound compared to that in the absence of the test compound compared to that in the absence of the test compound compared to that in the absence of the test compound compared to that in the anciet acid encoding the antileukoprotease in a mammal-derived cell population and comparing comparation of the nucleic acid encoding the antileukoprotease in a cancer reference profile indicates an adverse prognosis of the mammal. The method is used for diagnosing an inflammatory lung disorder such as emphysema, asthma. Pronchitis, or allergy in a mammal. The compound is useful for treating or preventing an inflammatory lung disorder such as emphysema, asthmaticular inhibiting antileukoprotease. The compound is useful for the method binds to inhibiting antileukoprotease. The compound is antileukoprotease compound is and is antileukoprotease. The compound is antileukoprotease.
                                                                                                                                                                                                                                                                                                          Diagnosing inflammatory lung disorders by comparing expression of nucleic acid encoding antiliquor polypeptide in mammal-derived cell population to nucleic acid encoding the polypeptide in reference profile.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibody, or antileukoprotease antisense nucleic acid. The methods are useful for assessing the prognosis of a mammal with thyroid carcinoma, ovarian carcinoma or renal cell carcinoma. The present sequence is a CDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            G; 151 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to methods of diagnosing breast cancer in a patient, which comprise detecting the level of expression in a tissue sample of two or more genes selected from those shown in ABT09867-ABT1112, where a differential expression of the genes indicates breast cancer. The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients. The methods are also useful as ascreening tool for agents that modulate the onset or progression of breast cancer. The breast cancer genes may be used as diagnostic markers for the prediction or identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in

The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACC50076 to ACC50334 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        138
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               198
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        258

                                                                                                            ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of the cancerous state of prostate cells. Also disclosed is a method of passessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level indicates that the patient is afflicted with prostate cancer.

Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in the DBPS177-AbB7S631 represent marker cDNA and proteins. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AlaGincysLeulrgTyrLysLysProGlucysGinSerAspTrpGincysProGlyLys 60

                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to novel NOVX proteins, and the DNA sequence which encode them, having properties related to stimulation of biochemical or physiological responses in a cell, a tissue, an organ or an organism.

Compounds which modulate the proteins of the invention may have cardiant, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antirheumatic, antiarteriosclerotic, hypotensive, cytostatic, anorectic, antirheumatic, immunosuppressive, antidabelic, nephrotropic, dermatological, antirheumatic, immunosuppressive, antipartinsmania, antiasthmatic, neuroleptic, nootropic, antipsoriatic, antipartinsonian, antiasthmatic, neuroleptic, notropic, antidepressant, antiallergic or gynaecological activities. The DNA sequences of the invention may be useful for gene therapy whilst the protein sequences of the invention may be useful in sequences of the invention and be useful in associated with a human disease. The invention may be useful in diagnosing, treating or preventing NOVX-associated disorders, for example cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, themmation, multiple sclerosis, Alzheimer's disease, cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, chemiston's disease, asthma, schizophrenia, depression, allergies or cardiomyopathy and pharmacogenemics. The nuclear sequence is the cDNA sequence medicine, and pharmacogenomics. The present sequence is the cDNA sequence which encodes the human NOVX27b protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TGGGCTGTGGAAGGCTCTGGAAAGTCCTTCAAAGCTGGAGTCTGTCCTCCTAAGAAATCT 138

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a method (M1) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.

considered probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of target polynuclectides. The microarray is particularly useful in the diagnosis and treatment regimens, drug the microarray is useful in diagnostica and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, consics and pharmacogenomics. The microarray is also useful for microarray is useful in the microarray is useful for microarray is also useful for microarray is also useful for conditionation of discasses and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mRNAs, cDNAs and genomic fragments and in research and diagnostic oppositions. The carray can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose to array can detect changes including cancer e.g. adenocarcinoma and lauksemia, immunopathies e.g. AIDS and asthma, neuropathies e.g. Alzkemia, immunopathies e.g. the printed specification but was obtained in electronic form directly from USPTO at sequence html?DocID=06500938BI

                                                                                                                                                                                                                                                                                                 The invention relates to a method of classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like tumor by: (1) determining a pattern of expression in the ovarian tumor of several markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in the ovarian tumor to a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor.
                                                                                                                                                                                                                                                                                                                                                                                                  This sequence corresponds to an ovarian cancer -related gene having an altered pattern of expression in ovarian cancer. (Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from WIPP at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ProThrArgArgLysProGlyLysCysProValThrTyrGlyGlnCysLeuMetLeuAsn 100

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a cutoimmune disease or arthritides. The method comprises obtaining a patient to diagnose or analyse the autoimmune disease or arthritides in a gene expression signature of the mRNA, analysing gene expression using that compression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention of the genes for targeting in the treatment of theumatoid arthritis; identification of cother than a mouse; diagnosis of rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; screening the efficacy of a candidate drug in vitro for the treatment of collagentinduced arthritis. The compositions of the invention have the following activities: immunosuppressive, antirheumatic, and immunosuppressive, antirheumatic, and immunosuppressive, antirheumatic, and immunosuppressive, antirheumatic, and immunosuppressive, antirheumatic, arthritis, and compositions of the present invention are useful for methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as crueded by an infactious agent. This polynucleositis, fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and immune disease caused by an infactious agent. This sequence is immune disease caused by an infactious agent. This sequence is crepresents a DNA sequence relating to the genes used in the analysis and treatment of autoimmune diseases or arthritides. Note: This sequence is cont shown in the specification. It has been supplied in an electronic

The invention relates to a composition of polynuclectide probes comprising first polynuclectide probes comprising at least a portion of a gene encoding a receptor-like polypeptide, second polynuclectide probes comprising at least a portion of a gene encoding at transducing comprising at least a portion of a gene encoding an effector-like polypeptide. The probes of the composition are useful as array elements in a microarray for monitoring the expression of target polynuclectides. The microarray for monitoring the expression of target polynuclectides. The microarray for monitoring contrological and treatment of cancer, an immunopathology or a diagnosis and treatment of cancer, an immunopathology or a malso be used for drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. Microarrays can also be used for drug discovery and development, toxicological and carcinogenicity studies, forensics or planmacogenomics. Microarrays can also be used for monitoring the progression of diseases that may be associated with the altered expression of signalling pathway polypeptides. The composition can also be used to purify a subpopulation of makNa, cDNNa, or genomic fragments in a sample. The expression profile is also useful for the diagnosis and treatment of cancer, e.g. cancers of the adrenal gland, bladder, bone, bone marrow, brain, breast or cervix, an immunopathology, e.g. Albs, disbetes, pancreatitis, osteoporosis or ulcerative colitis, or a neuropathology, e.g. dementia, amnesia, chims patent did not form part of the printed specification but was for obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              198

Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a method of detecting an ovarian cancer-
associated transcript in a cell from a patient, by contacting a
biological sample from the patient with a polymucleotide that selectively
hybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
                                                                                                                                                                                                                                                                                                            83 TGGGCTGTGGAAGGCTCTGGAAAGTCCTTCAAAGCTGGAGTCTGTCCTCCTAAGAAATCT

                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polypeptide see ACCS0076 to ACCS0334 and ABR47386 to ABR47381 in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Breast cancer diagnosis or treatment by comparing the level of exproof a marker in a patient sample with that in the control non-breast cancer sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Meyers R

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        80
                                                                                                                                                                                                                                                                                                                                                                                 82
in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The mucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, detection of the passing, and as vaccines. This sequence corresponds to one of the nucleic acids and as vaccines.
                                                                                                                                                                                                                                                                                                                                                MetLysSerSerGlyLeuPheProPheLeuValLeuLeuAlaLeuGlyThrLeuAlaPro

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a setiont sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that care expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention of the genes correlates with that of the gene signature. The invention of genes for targeting in the treatment of rheumatoid arthritis; identification of other than a mouse; diagnosis of rheumatoid arthritis; dasting the context than a mouse; diagnosis of rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; screening the cefficacy of a candidate drug in vitro for the treatment of collagentiduced arthritis. The compositions of the invention have the following activities: immunosuppressive, antirheumatic, antiantides, such as antiantidammatory, dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as themmatoid arthritis, lupus, ankylosing spondylitis, fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and sequence relating to the genes used in the analysis and treatment of autoimmune disease or arthritides. This sequence is immune disease caused by an infectious agent. This polymulescitie represents a DNA sequence relating to the genes used in the analysis and composition in the specification. It has been supplied in an electronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for the use of genes and proteins for diagnosing ovarian cancer and/or a likelihood for survival cor recurrence of the disease, where the expression of genes and proteins is up-regulated and down-regulated or associated with the occurrence or recurrence of a specific cancer sub-type. Also described: (1) detecting an ovarian cancer in a human or animal subject being tested; (3) detecting an ovarian cancer in a human or animal subject being tested; (3) detecting an ovarian cancer in a human or animal subject being tested; (3) detecting an ovarian cancer in a human or animal subject being tested; (3) detecting an ovarian cancer comprising polypeptide in a biological cancer; (5) determining the fiftcacy of a theraspeutic treatment of ovarian cancer; (6) an assay device for use in the diagnosis of rowarian cancer comprising polymucleotides or antibodies immobilised to a solid phase, where each of the antibodies binds to a polypeptide also given in the specification and each of the antibodies binds to a sesociated sequence has cytostatic activity, and can be used in gene candidate compound for the treatment of ovarian cancer. An ovarian cancer associated sequence has cytostatic activity, and can be used in gene therapy. An ovarian cancer cancer associated solvance or for the preparation of a medicament for the treatment of ovarian cancer.

                                                                                                                                                                                                                                                                                       82
                                                                                                     The invention relates to novel polynuclectide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynuclectides of the invention.

This invention describes novel nucleic acid (cDNA) sequences (A) which have anticancer activity and are highly expressed in ovarian tumor tissue (and some also in testis and breast cancer tissue). The products of the invention can be used for gene therapy. (A) are used (1) for recombinant expression of polypeptides (B) and (ii) to isolate complete genes. (B) are used (i) to identify agents suitable for treatment of ovarian cancer; (ii) directly for treating this form of cancer (including expression from gene therapy vectors) and (iii) for generation of specific antibodies. (A) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This particular tissue type before comparison of expression patterns. This particular tissue discorting the estimated frequency of courrence in a cunnown gene, discorting the estimated frequency of courrence in a particular tissue. AAZ77450-277572 represent the human ovarian tumor cDNA library derived EST fragments described in the method of the invention and encode the protein fragments represented in AAY76505-Y7663
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       40

sequences (I). (I) can have cytostatic, immunomodulatory and
neuroprotectivaties, and can be used in gene therapy. (I) and
proteins (II) encoded by then are used in high throughput screening
assays to select DNA molecules, RNA molecules, peptide nucleic acids,
mimetics, peptides, proteins, agonists, antagonists, antibodise or their
reagments, immunoglobulins, inhibitors, drug compounds and pharmaceutical
agents. Expression of (I) in a sample indicates the differentiation of
cembryonic stem cells into a tissue selected from brain, heart, kidney,
liver, lung, skeletal muscle or pancreatic tissues. (I) and (II) are used
to produce an expression profile that defines a metabolic or
developmental process, treatment, condition, disease or disorder. The
cepture of the can be used for diagnosis, prognosis or monitoring of
treatments and for investigating a predisposition to a disorder where the
center of a sasociated with a cancer, immunopathology or neuropathology
                                                                                                                                                                                     liver, uterus; ovary; stomach; intestine; kidney; pancreas; ss; metabolic disease; developmental disease; cytostatic; immunomodulatory; neuroprotective; gene therapy; cancer; immunopathology; neuropathology.

The invention relates to nucleic acid markers which are overexpressed in ovarian cancer cells as compared to their expression in normal (i.e. non-accercus) ovarian cells. The invention also relates to polypeptides encoded by the markers, antibodies that selectively bind to the polypeptides, a method of inhibiting ovarian cancer in a patient at risk of developing ovarian cancer involving inhibiting expression of a gene corresponding to a marker of the invention and a method of treating a patient afflicted with ovarian cancer comprising providing to cells of the patient an antisense oligonucleotide complementary to a marker of the
                                                                                                            Novel isolated nucleic acid molecules (markers) overexpressed in ovarian cancer cells as compared to their normal non-cancerous ovarian cells are used to characterize stage, grade, histological type of ovarian cancer.
                                                                                                                                                                                                                                                                                                                                          Disclosure; SEQ ID NO 20587; 106pp; English

invention. The markers are useful for assessing if a patient is afflicted with ovarian cancer, which involves comparing the level of expression of a marker in a patient sample and a normal level of expression of the marker in a control non-ovarian cancer sample. A difference between the expression levels indicates ovarian cancer. The level of expression of a marker corresponds to a secreted protein or to a transcribed corresponds to a secreted protein or to a transcribed protein or protein the presence in the sample, a protein or protein fragment corresponding to the marker. The presence of protein or protein fragment is detected using an antibody that specifically binds with the corresponding to the marker. Alternatively, the level of expression of the marker is assessed by detecting the presence of a transcribed to protein or protein fragment. Alternatively, the level of expression of the marker is also used for monitoring the presence of a transcribed or marker is also used for monitoring the progression of ovarian cancer in a patient sample at a first point in time, repeating the method at a subsequent camparing the level of expression. The method at a subsequent conditions this sequence represents a human ovarian comprising a marker. This sequence represents a human ovarian comprising a marker of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Zhong M,
```

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidabetic, ancoractic, cardiant, hypotensive, protozoacide, nootropic, cardiant, proparkinsonian, antiacnisant, osteopathic, contropic, antibacterial, fungicide, protozoacide, nootropic, contractive, antiinflammatory, dermatological, antisthmatic, and antibodies antiarthritic, antiinflammatory, dermatological, antisthmatic, and cardinflammatory, dermatological, antisthmatic, and antibodies in gene therapy. The polypeptides, nucleic acid molecules and antibodies care useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases with as metabolic disorders, clabetes, obesity, infectious diseases (viral, bacterial, fungal, clipatension, atherosociarous diseases (viral, bacterial, fungal, cheminthic, and protozoal), anorexia, cancer, cardiovascular diseases (obsecoarthritis), haematopoletic disorders, inflammatory skin disorders, asthma, and various disease, epilepsy, immune disorders (obsecoarthritis), haematopoletic disorders, inflammatory skin disorders, may also be used as targets for the identification of small molecules chat modulate or inhibit e.g. neurogenesis, cell differentiation, cell craft modulate or inhibit e.g. neurogenesis, cell differentiation, in gene

substances for used in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NoVX polypeptides of the invention show homology to certain known human proteins; NOV1a-1t show homology to fibroblast growth factor receptor 4 (FGFR4); NOV2a shows homology to complement factor i precursor; NOV3a shows homology to complement factor in precursor; NOV3a chown homology to matrix metalloproteinase-15 precursor; NOV4a shows homology to fibroblast growth factor-21 (FGF-21); NOV1a-7c show homology to alpha-2 macroglobulin-like polypeptide variant; NOV8a-8g show homology to alpha-2 macroglobulin-like polypeptide variant; NOV8a-8g show homology to alpha-2 macroglobulin-like concursor; NOV8a-9g show homology to LIV-1 protein; NOV1a shows homology to LIV-1 protein; NOV1a shows homology to LIV-1 protein; NOV1a shows homology to conclear hormone receptor NOR-1; NOV1a-11; show homology to beta-necendorphin transmembrane protein-like; NOV1a-12 show homology to beta-necendorphin changes and nover transmembrane protein-like; NOV1a-12 show homology to beta-necendorphin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ProProAsnPheCysGluMetAspGlyGlnCysLysArgAspLeuLysCysCysMetGly 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             79 resecreresaasecreresaaserecrecaasecresaserererecrerereaaaarer 138

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antisateriosclerotic, anorectic, cardiant, hypotensive, antisateriosclerotic, anorectic, virucide, antibacterial, fungicide, protozoacide, nootropic, virucide, antipacterial, fungicide, protozoacide, nootropic, antisathritic, antisathinamatory, dermatological, antisathmatic, and antibodies care useful in the manufacture of a medicament, costeopathic, antisathmatactury, dermatological, antisathmatic, and antibodies in gene therapy. The polypeptides, nucleic acid molecules and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder.

The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases und antibodies are useful for then interpolation disorders, diabetes, obesity, infectious diseases with an extablic disorders, disease, parkinson's disease, printing and antibodies and polypeptides of hypertension, atherosclerosis), neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, epilepsy, immune disorders, asthma, and various dyslipidaemias. The nucleic acids and polypeptides may albertation of antibodies cather modulate or inhibit e.g. neurogenesis, inflammatory skin disorders cather modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or disponsetic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, classe typing, preventive medicine, and pharmacogenenia, everyping, preventive medicine, and pharmacogenenia, everyping, prevention show homology to certain knowl numan probes, in chromoso
fibroblast growth factor receptor 4; FGFR4; complement factor I precursor; matrix metalloproteinase-15 precursor; MDC3; T-lymphocyte surface antigen Ly-9 precursor; fibroblast growth factor-21; FGF-21; alpha-2 macroglobulin-11ke polypeptide variant; antileukoproteinase 1 precursor; LIV-1; nuclear hormone receptor NOR-1; transmembrane protein-11ke; beta-neoendorphin-dynorphin precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiatreriosclerotic, anorectic, cardiant, hypotensive, antiatreriosclerotic, anorectic, cardiant, hypotensive, antiatreriosclerotic, anorectic, cardiant, hypotensive, antiatreriosclerotic, anorectic, cardiant, properties and antiatrerior antiatrhritic, antialifammatory, dermatological, antiathmatic, and antialifammatory, dermatological, antiathmatic, and antialifammatory, dermatological, antiathmatic, and antialifammatory, dermatological, antiathmatic, and antialifact at useful in the manufacture of the invention may have a use associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules in objactic disease such as metabolic disorders, diabetes, obesity, infectious diseases untibodiaes are useful for treating, preventing or diagnosing diseases untibodiaes are useful for treating, preventing or diagnosing diseases untibodiaes are useful for treating, preventing or diagnosing diseases untibodiaes are useful for cardiame. Albelmer's disease, parkinson's disease, parkinson's disease, parkinson's disease, epilepsy, immune disorders

Costeoarthritis), haematopoieric disorders, inflammatory skin disease, casthma, and various dyslipidaemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules casthma, and various dyslipidaemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules therapy, in generation of antibodies that bind immunospecifically to NOVX substances for use in therapeutic or diagnostic methods. The nucleic acids and polypeptides are in therapeutic or inhibides that bind immunospecifically to NOVX substances for use in their defined to recommend to recommend the substances for the molecules or the interpetation proposessis an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ly-9 precursor; NOV6a-6m show homology to fibroblast growth factor-21 (FGF-21); NOV7a-7c show homology to alpha-2 macroglobulin-like polypeptide variant; NOV9a-8g show homology to antileukoproteinase 1 precursor; NOV9a-9; show homology to LIV-1 protein; NOV10a shows homology to nuclear hormone receptor NOR-1; NOV11a-11j show homology to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NOVX polypeptides of the invention show homology to certain known human proteins: NOVIa-1t show homology to fibroblast growth factor receptor 4 (FGRR4); NOV2a shows homology to complement factor I precursor; NOV3a shows homology to complement factor I precursor; NOV3a howelogy to matrix metalloproteinase-15 precursor; NOV4a shows homology to MDC3; NOV5a-5c show homology to T-lymphocyte surface antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, cardiant, hypotensive, antiarteriosclerotic, anorectic, cardiant, hypotensive, antiarteriosclerotic, anorectic, neuroprotective, antiparkmonian, anticonvulsant, osteopathic, neuroprotective, antiparkmonian, anticonvulsant, osteopathic, antiarteritic, antinflammatory, dermatological, antiasthmatic, and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, benefers), obesity, infectious diseases (viral, bacterial, fungal, contents, and protozoal), anorexia, cancer, cacidiovascular diseases (belmithic, and protozoal), anorexia, cancer, cacidiovascular diseases (belmithic, and protozoal), anorexia, cancer, cacidiovascular diseases (belmithic, and protozoal), anorexia, cancer, cacidiovascular diseases (consease, parkinson's disease, epilopsy, immune disorders, Alzheimer's costhma, and various dyslipidaemias. The nucleic acids and polypeptides (costeoarthritis), haematopoietic disorders, inflammatory skin disorders, that modulate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation of antibodies that bind immunospecifically to NoVX substances for use in therapeutic or diagnostic methods. The nucleic acids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NoVX substances for use in therapeutic or diagnostic methods. The NoVX substances for use and therapeutic or diagnostic methods of the invention show homology to certain known human proteins NoVIa shows homology to complement factor I precursor; NOVIa shows homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ly-9 precursor, NOVGa-6m show homology to T-lymphocyte surface antigen Ly-9 precursor; NOVGa-6m show homology to fibroblast growth factor-21 (FGF-21); NOVGa-7c show homology to alpha-2 macroglobulin-like polypeptide variant; NOVGa-8g show homology to antileukoproteinase 1 precursor; NOV9a-9i show homology to LIV-1 protein; NOV10a shows homology to LIV-1 protein; NOV10a shows homology to muclear hormone receptor NOR-1; NOV11a-11j show homology to transmembrane protein-like; NOV12a-12c show homology to beta-necendorphin -dynorphin precursor. The present sequence encodes a NOVX polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Padigaru M, Rieger DK;

The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the acceptication. A polypeptide of the invention has antidabetic, anorectic, cardiant, hypotensivo, antiarterinatic, anotropic, corructed, antibatematic, and acceptable, processedie, notropic, neuroprofective, antibathmatoxy, dermatological, antiasthmatic, and antibodies are useful in the manufacture of a medicant for treating and antibodies are useful in the manufacture of a medicant for treating asyndrome associated with a human disease, preferably a NOVX-associated disorder. The notice caid molecules, polypeptides and antibodies are useful for treating, preventing or disgnosing diseases such as metabolic disorders, disbetty, infectious diseases use and antibodies are useful for treating, preventing or disgnosing diseases such as metabolic disorders, disbetty, infectious diseases with an metabolic disorders, helminthic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis) neurodegenerative disorders, and protozoal), anorexia, inflammatory skin disorders, costeoarthritis), hammatopoletic disorders, inflammatory skin disorders, costeoarthritis), hammatopoletic disorders, inflammatory skin disorders, asthma, and various dyslipidaemias. The nucleic acids and polypeptides may also be used as targets for the identification of small molecules continuing the modulate or inhibit e.g. neurogenesis, cell differentiation, cell proteins understances for use in therapeutic or disapones. The nucleic acids and polypeptides of the invention of antibodies that bind immunospecifically to NOVA substraints who whomology to fibroblast growth factor receptor of FEGF21) NOVA-10 to metabolic to medicant factor in precursor; NOVA-2 show homology to alpha-2 macroplobulin-like of nomology to maint metabolic scomplement factor in precursor; NOVA-3 show homology to alpha-2 macroplobulin-like of transmembrane protein-like; NOVA-2-11 show was anowed homology to alu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                Rieger DK;

The methods are useful for treating cancer, e.g. breast cancer. This sequence represents a gene product which is differentially expressed in breast cancer cells. The sequence can be used in the method of the invention.

Observationally, naginal opposite the intraminatory state and polypeptides may also be used as targets for the identification of small molecules may also be used as targets for the identification of small molecules that maddilate or inhibit e.g. neurogenesis, cell differentiation, cell proliferation, haematopoiesis, wound healing and angiogenesis, in gene therapy, in generation of antibodies that bind immunospecifically to Novx substances for use in therapeutic or diagnostic methods. The nucleic caids are further used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The NovX polypeptides of the invention show homology to certain known human proteins. NoVa at show homology to fibroblast growth factor receptor (FGFR4); NOV2a shows homology to complement factor I precursor; NOV3a shows homology to complement factor I precursor; NOV4a shows homology to fibroblast growth factor-21 (FGF-21); NOV2a show homology to fibroblast growth factor-21 (FGF-21); NOV3a -7c show homology to fibroblast growth factor-21 (FGF-21); NOV3a -7c show homology to fibroblast growth factor-21 (FGF-21); NOV3a -7c show homology to fibroblast growth factor-21 (FGF-21); NOV3a -7c show homology to fibroblast growth factor-21 (FGF-21); NOV3a-9i show homology to fibroblast growth factor-21 (FGF-21); NOV3a-9i show homology to fibroblast shows homology to cursor: NOV3a-9i show homology to fibroblast shows homology to cursor: NOV3a-1ike, NOV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel isolated polypeptide (NOVX) comprising a mature form of any of the 37 amino acid sequences fully defined in the specification. A polypeptide of the invention has antidiabetic, anorectic, cardiant, hypotensive, antiatreriosclerotic, anorectic, cardiant, hypotensive, antiatreriosclerotic, anorectic, cardiant, hypotensive, anticonvulsant, osteopathic, neuroprotective, antipparkinsonian, anticonvulsant, osteopathic, antiatrhritic, antiinflammatory, dermatological, antiasthmatic, and antiabodies are useful in the manufacture of a medicament for treating a syndrome associated with a human disease, preferably a NOVX-associated disorder. The nucleic acid molecules, polypeptides and antibodies are useful for treating, preventing or diagnosing diseases such as metabolic disorders, diabetes, obesity, infectious diseases (viral, bacterial, fungal, halmitchic, and protozoal), anorexia, cancer, cardiovascular diseases (hypertension, atherosclerosis), neurodegenerative disorders, disease, parkinson's disease, polippsy, immune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                       Padigaru M,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      à
                                                                                                                                                                                                             The invention relates to human novel polynucleotide and polypeptide sequences useful as reagents in forensic analyses, as chromosome markers, as tissue/cell/organelle-specific markers, in producing expression vectors, or in screening and diagnostic assays. The invention is used as reagents in screening and diagnostic assays for abnormal novel expression and/or biological activity, and in screening compounds that may be used in the treatment of novel-related disorders, e.g. neurological disorders. The novel gene is also used in gene therapy. The present sequence is human secretory leukocyte proteinase inhibitor variant (Sepin) cDNA, a

The invention relates to a method of classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by: (1) determining a pattern of expression in the ovarian tumor of seweral markers given in the specification; and (2) comparing a similarity of the pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in the ovarian tumor to a pattern of expression of the markers in a comparison tissue of a known BRCA-1-like or BRCA-1-like or non-BRCA-like tumor. The method is useful for classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor. This sequence corresponds to an ovarian cancer -related gene having an altered pattern of expression in ovarian cancer. (Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Classifying an ovarian tumor as a BRCA-1-like or BRCA-2-like or non-BRCA-like tumor by determining a pattern of expression in the ovarian tumor of several markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     347
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CTTGCCCTGGGAACTCTGGCACCTTGGGCTGTGGAAGGCTCTGGAAAGTCCTTCAAAGCT 467

The present invention describes a DNA sequence (A) encoding an analogue of a mammalian serine protease inhibitor (B). The DNA sequences and recombinant methods allow manufacture of a class of inhibitors of e.g. cathepsin G, elastase, and trypsin, with different specificities. The recombinant serine protease product can be directed to act intracellularly or extracellularly and is useful in treating conditions caused by a disturbance in the native protease/protease inhibitor balance of such as emphysema, arthritis, glomerulonephritis, peridontitis, muscular dystrophy, tumour invasion, sepsis, and acute leukemia. (A) allows (B) to be recombinantly produced in sufficient quantities and purities so as to provide economical pharmaceutical compositions. (B) is resistant to heat, acid, and a variety of proteolytic enzymes, is thermodynamically stable in extracellular conditions, and exhibits a high degree of self assembly forming an active tertiary structure in the absence of biochemical compositions. (Updated on 20-MAR-2003 to correct PR field.)

sequence coding for ompA SLPI

```
This invention relates to new purified and isolated mammalian serine protease inhibitors proteins which comprise at least 8 cysteine residues and no more than 107 amino acids. The protease inhibitors are capable of inhibiting chymotrypsin and elsetses. Sequences AAC97526 - AAC97534, AAC97534 - AAC97534 and AAC97544 - AAC97534 and AAC97534 and invention, and include oligonucleotide sequences used in the isolation and characterisation of the proteins. Primers AAC97535 - AAC97538 - AAC97538 - AAC97538 - AAC97538 - AAC97537 and AAC95582 - AAC97613 are used in the social protease inhibitors. Peptide sequences ABS3122 represent the protease inhibitors of the invention and various other peptides used in the isolation of the protease inhibitors are used in the isolation of the protease inhibitors. The serine protease inhibitor protein is useful for treating a protease mediated condition, which includes protease mediated tissue destruction, e.g. e.g. emphysema, arthritis, glomerulonephritis, periodontitis, muscular dystrophy or tumour invasion. It is also useful for modulating protease activity. The DAMS are useful for producing the proteins, especially by
                         mediated condition or tissue destruction e.g. emphysema or tumor invasion and for recombinant production of inhibitors.

```
The invention relates to a DNA sequence encoding an analog of a mammalian serine protease inhibitor protein. The analog comprises at least eight expetance residues and possesses serine protease inhibitor activity, and at least one operational element consisting of a promoter, an operator, a leader sequence, a Shine-Dalgarno sequence, a ribosome binding site or a terminator codon. The DNA is useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukocyte elastase or trypsin. The present sequence represents the DNA sequence coding for ompA-secretory leukocyte protease inhibitor (SLPI)
                                                                                                                                                                                                                                                                                                                                                                                                        New DNA sequences, useful in recombinant DNA techniques for directing the production of a serine protease inhibitor protein, e.g. leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     229

The fusion protein of the invention is useful for inhibiting protease activity associated with a disorder such as emphysema, asthma, chronic obstructive pulmonary disease, cystic fibrosis, otitis media, ottis external or HIV infection, or for treating an individual suffering from or at risk for a disease or disorder involving unwanted protease activity. The proteins are useful for treating psoriasis, in inflammatory responses to viral infection, and for treating wounds, sepsis, theumatoid architis, periodonical disease, tumour metastasis and tumour angiogenesis, gastric ulceration, osteoporosis, paget's disease, ajomerulonephritis, scleroderma, malaria, bacteorial, infection, Alzheimer's disease, hypertension and muscular dystrophy. The present sequence represents the DNA encoding the rSLAPI fusion protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1239 rccecrcaarerrigagaracaagaageccagaarercaareceacrescaarercaeer 1298
